

角柱の体積 = 底面積 × 高さ

三角柱

$$\frac{4 \times 3 \times \frac{1}{2}}{\text{底辺} \times \text{高さ}} \times 6 = 36 \text{ cm}^3$$

四角柱

$$\frac{3 \times 5}{\text{たて} \times \text{横}} \times 7 = 105 \text{ cm}^3$$

円柱の体積 = 底面積 × 高さ

$$\frac{3 \times 3 \times \pi}{\text{半径} \times \text{半径}} \times 7 = 63\pi \text{ cm}^3$$

角錐の体積 = $\frac{1}{3}$ × 底面積 × 高さ

$$\frac{1}{3} \times \frac{4 \times 4}{\text{一辺} \times \text{一辺}} \times 6 = 32 \text{ cm}^3$$

円錐の体積 = $\frac{1}{3}$ × 底面積 × 高さ

$$\frac{1}{3} \times \frac{5 \times 5 \times \pi}{\text{半径} \times \text{半径}} \times 12 = 100\pi \text{ cm}^3$$
